

The alignment in the shifted Hurwitz family

$\rho'_j(0) = \rho_j \zeta(\rho_j + 1) / \zeta'(\rho_j)$ • original coordinates retained

Five tracked branches meet the critical line at the same parameter

First 60: 29 right, 31 left

What was checked

- 45-digit numerical continuation, with residual checks
- Endpoints refined independently at 80 digits
- All 60 signs agree with the saved interval calculation
- Actual zeros also computed at $t = \pm 10^{-4}$

The curves are numerical branch tracking.
They are not an all-zero theorem or a global interval certificate.
