

Every divisor contribution remains in the receiving equation

Original zeta: the full multiplier and its inverse have specified domains

$$C(s) = s(s - 1)\pi^{-s/2}\Gamma(s/2)$$

$$D_C = [1] - \sum_{n \geq 1} [-2n]; \text{ every local unit, jet and support label is retained.}$$

Actual exceptional stalks

Point	Original z_t	Multiplier C
1	simple pole	simple zero
$-2n$	simple zero	simple pole
0	$-8H_t(i)$	-2

$$\text{Res}_1 z_t = 16H_t(i) = -2z_t(0) > 0$$

The zero at $-2n$ has a nonzero twisted fibre.
Ordinary evaluation and that fibre have different, explicit maps.

One fixed test at physical time zero
