

The actual supported-zero action and its computed metric defect

P_T : the G -orthogonal projection onto $\text{im}(E_T)$

$$N_T = E_T - P_T, \quad N_T^2 = 0, \quad \|N_T\|_G^2 = (K_s/K_c)c(T)^2$$

$N_T = 0$ exactly at $T_* = (R/A)^2/(4\pi)$; theta time stays $t = 1/32$.
